

IQS7211A DATASHEET

Versatile Trackpad/ touchscreen controller with proximity,
touch, trackpad and gesture outputs

1 Device Overview

The IQS7211A ProxFusion® IC is a capacitive touch and proximity trackpad/touchscreen controller implementation. The IQS7211A features best in class sensitivity, signal-to-noise ratio and automatic tuning of electrodes. Low power proximity detection allows extreme low power operation.

1.1 Main Features

- > Highly flexible ProxFusion® device
- > 12 (QFN20) / 10 (WLCSP18) external sensor pad connections
- > Self/Mutual capacitive sensors configuration for display wake-up
- > ULP wake-up on touch
 - Dedicated Ultra Low Power wake-up touch sensor or
 - Wake-up on screen/trackpad
- > Sensor flexibility
 - Automatic sensor tuning for optimum sensitivity
 - Internal voltage regulator
 - Reference capacitor
 - On-chip noise filtering
 - Detection debounce and hysteresis
 - Wide range of capacitance detection
- > Trackpad/Touchscreen
 - Up to 2 fingers tracking
 - High resolution coordinate outputs
 - Fast response: Coordinate report rate up to 100Hz
 - Individual sensor touch (for up to 32 touch key applications)
 - Integrated touch size output (area and strength) for touch integrity
 - Single finger gesture recognition engine
 - Electrode mapping for optimal PCB layout
 - Configurable coordinate resolution and orientation
 - Compatible with wide range of overlay materials and thicknesses
 - Compatible with multiple 1-and 2-layer sensor patterns
 - Adjustable sensing frequency offset for limiting potential display interference
 - No calibration required - systems automatically compensated for mechanical & temperature changes
 - Water immunity features
- > Design and manufacturing support
 - Touch pattern layout drawing
 - Full FPC layout package (example & customized)
 - Test guide for touch pattern
 - RFI immunity design support
- > Design simplicity
 - PC Software for debugging and obtaining optimal performance
 - One-time settings programming (during MP) or pre-programmed devices
 - Auto-run from programmed settings for simplified integration
 - No production line calibration required
- > Display cover lens thickness
 - Minimum thickness: 0.5mm
 - Maximum thickness: 2-4mm depending on design parameters
- > Minimize display noise
 - Advanced DSP for touch performance

- Display and charger interference avoidance
- Auto adjusting digital filters
- > Supports different display touch panel types
 - On-cell
 - Add-on touch panel
- > Supporting up to 2.5" panels
- > Screen resolution
 - 256 per channel
 - Example: 1792x768 (8x4 channels), 1280x1024 (6x5 channels)
- > Automated system power modes for optimal response vs consumption
- > I²C communication interface with IRQ/RDY(up to fast plus -1MHz)
- > Event and streaming modes
- > Customizable user interface due to programmable memory
- > Supply voltage
 - 1.8V(-5%) to 3.5V @ 14MHz
 - Minimum 2.2V @ 18MHz
- > Small packages
 - WLCSP18 (1.62x 1.62x0.5 mm) - interleaved 0.4mm x 0.6mm ball pitch
 - QFN20 (3 x 3 x 0.5 mm) - 0.4mm pitch

1.2 Applications

- > Fitness bands
- > True Wireless Stereo (TWS) earbuds
- > Game controller touch pads
- > Headphones

3 Electrical Characteristics

3.1 Absolute Maximum Ratings

Table 3.1: Absolute Maximum Ratings

	Min	Max	Unit
Voltage applied at VDD pin to VSS	1.71	3.5	V
Voltage applied to any ProxFusion® pin	-0.3	VREGA	V
Voltage applied to any other pin (referenced to VSS)	-0.3	VDD + 0.3 (3.5 V max)	V
Storage temperature, T _{stg}	-40	85	°C

3.2 Recommended Operating Conditions

Table 3.2: Recommended Operating Conditions

Recommended operating conditions		Min	Nom	Max	Unit
VDD	Supply voltage applied at VDD pin: F _{OSC} = 14 MHz F _{OSC} = 18 MHz	1.71 2.2		3.5 3.5	V
VREGA	Internal regulated supply output for analog domain: F _{OSC} = 14 MHz F _{OSC} = 18 MHz	1.49 1.7	1.53 1.75	1.57 1.79	V
VREGD	Internal regulated supply output for digital domain: F _{OSC} = 14 MHz F _{OSC} = 18 MHz	1.56 1.75	1.59 1.8	1.64 1.85	V
VSS	Supply voltage applied at VSS pin		0		V
T _A	Operating free-air temperature	-40	25	85	°C
C _{VDD}	Recommended capacitor at VDD	2×C _{VREGA}	3×C _{VREGA}		μF
C _{VREGA}	Recommended external buffer capacitor at VREGA, ESR ≤ 200 mΩ	2	4.7	10	μF
C _{VREGD}	Recommended external buffer capacitor at VREGD, ESR ≤ 200 mΩ	2	4.7	10	μF
C _{XSELF-VSS}	Maximum capacitance between ground and all external electrodes on all ProxFusion® blocks (self-capacitance mode)	1	-	400 ⁱ	pF
C _{mCTx-CRx}	Capacitance between Receiving and Transmitting electrodes on all ProxFusion® blocks (mutual-cap mode)	0.2	-	9 ⁱ	pF
C _{pCRx-VSS-1M}	Maximum capacitance between ground and all external electrodes on all ProxFusion® blocks (mutual-capacitance mode @ f _{xfer} = 1 MHz)			100 ⁱ	pF
C _{pCRx-VSS-4M}	Maximum capacitance between ground and all external electrodes on all ProxFusion® blocks (mutual-capacitance mode @ f _{xfer} = 4 MHz sensing)			25 ⁱ	pF
$\frac{C_{pCRx-VSS}}{C_{mCTx-CRx}}$	Capacitance ratio for optimal SNR in mutual capacitance mode ⁱⁱ	10		20	n/a
RC _{XCRx/CTx}	Series (in-line) resistance of all mutual capacitance pins (Tx & Rx pins) in mutual capacitance mode	0 ⁱⁱⁱ	0.47	10 ^{iv}	kΩ
RC _{XSELF}	Series (in-line) resistance of all self capacitance pins in self capacitance mode	0 ⁱⁱⁱ	0.47	10 ^{iv}	kΩ

3.3 ESD Rating

Table 3.3: ESD Rating

		Value	Unit
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ^v	±4000	V

ⁱRC_x = 0 Ω

ⁱⁱPlease note that the the maximum values for C_p and C_m are subject to this ratio

ⁱⁱⁱNominal series resistance of 470 Ω is recommended to prevent received and emitted EMI effects. Typical resistance also adds additional ESD protection

^{iv}Series resistance limit is a function of f_{xfer} and the circuit time constant, RC. $R_{\max} \times C_{\max} = \frac{1}{(6 \times f_{xfer})}$ where C is the pin capacitance to VSS.

^vJEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±4000 V may actually have higher performance.

3.4 Current Consumption

The specific parameters configured on varying designs have a great impact on the obtained current consumption. Due to this, the following table is purely illustrative of the expected consumption^{vi} for similar configurations. The device configurations used below are examples of practical setups expected in applications. The main oscillator frequency was set to 14MHz for all measurements.

Table 3.4: Current Consumption

Power mode	Active channels	Report rate [ms]	Auto-prox cycles	Setup	Current [μA]
Active Mode	Trackpad (30 Channel)	10	N/A	Configured as a 5x6 trackpad ATI Target of 300 counts 1.4MHz conversion frequency 1 finger touch (8mm diameter) active Streaming data 0x10 - 0x1B (24 bytes)	1320
Idle Mode	Trackpad (30 Channel)	50	N/A	Same as above but no touch, and no I ² C	190
Low Power 1	Wake-up on Trackpad	100	4	ALP configured with ATI Target of 200 counts 5 Rxs and 3 Txs active 1.4MHz conversion frequency No user interaction / No comms (event mode)	8
Low Power 2	Wake-up on Trackpad	200	32	ALP configured with ATI Target of 200 counts 5 Rxs and 3 Txs active 1.4MHz conversion frequency No user interaction / No comms (event mode)	4

^{vi}Bench measurements, not characterised over volume.

4 Timing and Switching Characteristics

4.1 Reset Levels

Table 4.1: Reset Levels

Parameter		Min	Typ	Max	Unit
V _{VDD}	Power-up/down level (Reset trigger) – slope > 100 V/s	1.040	1.353	1.568	V
V _{VREGD}	Power-up/down level (Reset trigger) – slope > 100 V/s	0.945	1.122	1.304	V

4.2 MCLR Pin Levels and Characteristics

Table 4.2: MCLR Pin Characteristics

Parameter		Conditions	Min	Typ	Max	Unit
V _{IL(MCLR)}	MCLR Input low level voltage	VDD = 3.3 V	VSS – 0.3	-	1.05	V
		VDD = 1.7 V			0.75	
V _{IH(MCLR)}	MCLR Input high level voltage	VDD = 3.3 V	2.25	-	VDD + 0.3	V
		VDD = 1.7 V	1.05			
R _{PU(MCLR)}	MCLR pull-up equivalent resistor		180	210	240	kΩ
t _{PULSE(MCLR)}	MCLR input pulse width – no trigger	VDD = 3.3 V	-	-	15	ns
		VDD = 1.7 V			10	
t _{TRIG(MCLR)}	MCLR input pulse width – ensure trigger		250	-	-	ns

Figure 4.1: MCLR Pin Diagram

4.3 Miscellaneous Timings

Table 4.3: Miscellaneous Timings

Parameter		Min	Typ	Max	Unit
f _{xfer}	Charge transfer frequency (derived from f _{OSC})	42	500 – 1500	4500	kHz
f _{OSC}	Master CLK frequency tolerance 14 MHz	13.23	14	14.77	MHz
f _{OSC}	Master CLK frequency tolerance 18 MHz	17.1	18	19.54	MHz

4.4 Digital I/O Characteristics

Table 4.4: Digital I/O Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
V_{OL}	SDA & SCL Output low voltage	$I_{sink} = 20\text{ mA}$		0.3	V
V_{OL}	GPIO ⁱ Output low voltage	$I_{sink} = 10\text{ mA}$		0.15	V
V_{OH}	Output high voltage	$I_{source} = 20\text{ mA}$	$VDD - 0.2$		V
V_{IL}	Input low voltage	$VDD \times 0.3$			V
V_{IH}	Input high voltage			$VDD \times 0.7$	V
C_{b_max}	SDA & SCL maximum bus capacitance			550	pF

4.5 I²C Characteristics

Table 4.5: I²C Characteristics

Parameter	VDD	Min	Typ	Max	Unit
f_{SCL}	SCL clock frequency	1.8 V, 3.3 V		1000	kHz
$t_{HD,STA}$	Hold time (repeated) START	1.8 V, 3.3 V	0.26		μs
$t_{SU,STA}$	Setup time for a repeated START	1.8 V, 3.3 V	0.26		μs
$t_{HD,DAT}$	Data hold time	1.8 V, 3.3 V	0		ns
$t_{SU,DAT}$	Data setup time	1.8 V, 3.3 V	50		ns
$t_{SU,STO}$	Setup time for STOP	1.8 V, 3.3 V	0.26		μs
t_{SP}	Pulse duration of spikes suppressed by input filter	1.8 V, 3.3 V	0	50	ns

Figure 4.2: I²C Mode Timing Diagram

ⁱRefers to TX9, TX10, TX11, and RDY pins

5 Proxfusion® Module

The IQS7211A contains a ProxFusion® module that uses patented technology to measure and process the capacitive sensor data. The channel touch output is the primary output from the sensors. These are processed further to provide secondary trackpad outputs that include finger position, finger size as well as on-chip gesture recognition.

5.1 Trackpad Channels

On a trackpad sensor (typically a diamond shape pattern), each intersection of an Rx and Tx row/column forms a mutual-capacitive sensing element which is referred to as a *channel*. Each channel has an associated count value, reference value and touch status.

5.1.1 Channel Numbers

Trackpad channels are numbered from 0 to $(TotalRxs * TotalTx) - 1$. They are assigned from the top-left corner, first along the Rxs before stepping to the next Tx. The channel number must be known for some settings such as allocating channels into sensing cycles (timeslots). Here is an example of a 4x3 trackpads' channel numbers:

Table 5.1: Channel Number Assignment

	Rx0 (Column 0)	Rx4 (Column 1)	Rx1 (Column 2)	Rx5 (Column 3)
Tx8 (Row 0)	0	1	2	3
Tx10 (Row 1)	4	5	6	7
Tx2 (Row 2)	8	9	10	11

5.2 Alternate Low-Power Channel (ALP)

To provide lower power consumption, the trackpad can be configured as a single sensor in LP1 and LP2, instead of sensing the individual trackpad channels. This channel has a lot of setup flexibility:

- > *Sensing method*: mutual capacitive or self-capacitive (*Sensor Type*).
- > *Multiple electrode selection*: which Rxs (*Rx EN*) / Tx (*ALP Tx Enable*) are active during conversions.
- > *Auto-prox*: autonomous sensing cycles while core is asleep (*LPX Auto Prox Cycles*) giving further power saving, but similar wake-up capability.
- > *Count value filtering* (*ALP Filter*): gives reliable proximity detection in noisy environments.
- > *Single channel*: since the alternate channel is processed as only a single channel, much less processing is done, allowing for lower overall power consumption.

5.3 Count Value

The capacitive sensing measurement returns a *count value* for each channel. Count values are inversely proportional to capacitance, and all outputs are derived from this.

5.3.1 Trackpad Count Values

The individual trackpad channel count values (*Count values*) are unfiltered.

5.3.2 ALP Count Values

If RxS from both prox engine A and B are enabled, there will be two count measurements (*ALP count A*) / (*ALP count B*). To reduce processing time (and thus decrease current consumption) the measurements are added together (*ALP count value*) and processed as a single channel. A count value filter is implemented on this channel to give stable proximity output for system wake-up from low-power mode. It is recommended to leave this count filter enabled (*ALP Filter*). The amount of filtering can be modified (*ALP count beta*) if required. This beta is used as follows to determine the damping factor of the filter:

$$\text{Count damping factor} = \text{Beta} / 256$$

If the beta is small, the filtering is stronger (filtered count follows raw count slower), and if the beta is larger, the filtering is weaker (filtered count follows raw count faster).

5.3.3 Max Count

Each channel is limited to having a count value smaller than the configurable limit (*Max Count*). If the ATI setting or hardware causes measured count values higher than this, the conversion will be stopped, and the max value will be read for that relevant count value.

5.3.4 Trackpad Delta Value

The signed delta values (*Trackpad delta values*) are simply:

$$\text{Delta} = \text{Count} - \text{Reference}$$

5.4 Reference Value/Long-Term Average (LTA)

User interaction is detected by comparing the measured count values to some reference value. The reference value/LTA of a sensor is slowly updated to track changes in the environment and is not updated during user interaction.

5.4.1 Trackpad References

The trackpad *reference values* are a two-cycle average of the count value, stored during a time of no user activity, and thus is a non-affected reference. The trackpad reference values are only updated from LP1 and LP2 mode when modes are managed automatically, where no user interaction is assumed. Thus, if the system is controlled manually, the reference must also be managed and updated manually by the host.

The reference value is updated or refreshed according to a configurable interval (*Reference update time*), in seconds. The Reference update time has a maximum setting of *60 seconds*.

5.4.2 ALP Long-Term Average

The ALP channel does not have a snapshot reference value as used on the trackpad but utilises a filtered long-term average value (*ALP LTA*). The LTA tracks the environment closely for accurate comparisons to the measured count value, to allow for small proximity deviations to be sensed. The speed of LTA tracking can be adjusted with the *ALP LTA beta*. There is a beta for LP1 and LP2. This is to allow different settings for different report rates, so that the speed of LTA tracking can remain the same.

5.4.3 Reseed

Since the *Reference* (or *LTA* for ALP channel) is critical for the device to operate correctly, there could be known events or situations which would call for a manual reseed. A reseed takes the latest measured counts, and seeds the *reference/LTA* with this value, therefore updating the value to the latest environment. A reseed command can be given by setting the corresponding bit (*TP Reseed* / *ALP Reseed*).

5.5 Channel Outputs

5.5.1 Trackpad Touch Output

The trackpad touch output (*Touch status*) is set when a channel's count value increases by more than the selected threshold.

The touch threshold for a specific channel is calculated as follows:

$$\text{Threshold} = \text{Reference} \times (1 + \text{Multiplier} / 128)$$

where *Multiplier* is an 8-bit unsigned value for both the 'set' and 'clear' threshold, allowing a hysteresis to provide improved touch detection. A smaller fraction will thus be a more sensitive threshold.

5.5.2 ALP Output

This output (*ALP Output Status*) is set when a channel's count value deviates from the LTA value by more than the selected threshold - thus a delta setting (*ALP output threshold*). This can be used to implement a proximity or touch detection, depending on the threshold used.

5.5.3 Output Debounce

There is no debounce on the trackpad touch detection (or release). This is because debouncing adds too much delay, and fast movements on the touch panel cannot be debounced fast enough to provide reliable XY output data.

Debounce on the ALP output is however done, to allow for stable proximity detection if needed. An 8-bit unsigned value is used for the set and clear debounce parameter (*ALP set/clear debounce*).

5.6 Automatic Tuning Implementation (ATI)

The ATI is a sophisticated technology implemented in the new ProxFusion® devices to allow optimal performance of the devices for a wide range of sensing electrode capacitances, without modification to external components. The ATI settings allow tuning of various parameters.

The main advantage of the ATI is to balance out small variations between trackpad hardware and IQS7211A variation, to give similar performance across devices and temperature.

For a detailed description of ATI, please contact Azoteq.

5.6.1 ATI Coarse Divider/ Multiplier

The *ATI coarse divider / multiplier* can be used to configure the base value for the trackpad and ALP channels. There is one global setting parameter for all the active trackpad channels for the course

divider and one for the course multiplier. The divider is a 5-bit setting (0-31) and the multiplier a 4-bit setting (0-15).

5.6.2 ATI Fine Divider

The *ATI fine divider* is also used to configure the trackpad and ALP base value. There is one global setting parameter for all the active trackpad channels for the fine divider. The divider is a 5-bit setting (0-31).

5.6.3 ATI Compensation (and ATI Target)

The ATI Compensation value for each channel (*ATI compensation*) and (*ALP ATI compensation*) is set by the ATI procedure, and are chosen so that each count value is close to the selected target value (*TP ATI target* / *ALP ATI target*). The algorithm is queued using *TP / ALP Re-ATI*.

The *TP / ALP Re-ATI* bits clear automatically on chip when the algorithm has completed.

The queued re-ATI routine will execute as soon as the corresponding channels are sensed. For example, the trackpad re-ATI when the system is in Active, Idle-Touch or Idle mode, and the ALP re-ATI when the system is in LP1 or LP2.

The ALP channel has individual compensation values (*ALP ATI compensation*) for both proximity engines A (Rx0-3) and B (Rx4-7).

The ALP ATI target value applies to each of the individual count values configured for the ALP channel. The combined channel will thus have a count near the sum of the ATI target.

This routine will only execute after the communication window is terminated, and the I²C communication will only resume once the ATI routine has completed.

ATI compensation is 10-bit value, thus 0 to 1023.

5.6.4 ATI Divider

The ATI Compensation can be scaled by means of the *Trackpad ATI compensation divider* / *ALP ATI compensation divider*. Since the 'size' of compensation is scaled, a small divider value will relate to large compensation, meaning the step size of each compensation unit increase will be larger. For smaller more accurate compensation steps, a larger divider is selected, but the 'range' of compensation is then reduced.

5.7 Automatic Re-ATI

5.7.1 Description

When enabled (*TP Re-ATI EN*) or (*ALP Re-ATI EN*) a re-ATI will be triggered if certain conditions are met. One of the most important features of the re-ATI is that it allows easy and fast recovery from an incorrect ATI, such as when performing ATI during user interaction with the sensor. This could cause the wrong ATI Compensation to be configured, since the user affects the capacitance of the sensor. A re-ATI would correct this. It is recommended to always have this enabled. When a re-ATI is performed on the IQS7211A, a status bit will set momentarily to indicate that this has occurred (*TP / ALP ReATI Occurred*).

5.7.2 Conditions for Re-ATI to activate

1. Reference drift

A re-ATI is performed when the reference of a channel drifts outside of the acceptable range around the ATI Target. The boundaries where re-ATI occurs for the trackpad and ALP channels are independently set via the drift threshold value (*Reference drift limit / ALP LTA drift limit*). The re-ATI boundaries are calculated from the delta value as follows:

$$\text{Re-ATI Boundary} = \text{ATI target} \pm \text{Drift limit}$$

For example, assume that the ATI target is configured to 800 and that the reference drift value is set to 50. If re-ATI is enabled, the ATI algorithm will be repeated under the following conditions:

$$\text{Reference} > 850 \text{ or } \text{Reference} < 750$$

The ATI algorithm executes in a short time, so goes unnoticed by the user.

2. Decreased Count Value

This condition is only valid for trackpad channels. A considerable decrease in the count value of a channel is abnormal since user interaction increases the count value. Therefore, if a decrease larger than the configurable threshold (*Trackpad minimum count re-ATI value*) is seen on such a channel, it is closely monitored. If this is continuously seen for 15 cycles, it will trigger a re-ATI.

5.7.3 ATI Error

After the ATI algorithm is performed, a check is done to see if there was any error with the algorithm. An ATI error is reported if one of the following is true for any channel after the ATI has completed:

- > ATI Compensation = 0 (min value)
- > ATI Compensation = 1023 (max value)
- > Count is already outside the re-ATI range upon completion of the ATI algorithm

If any of these conditions are met, the corresponding error flag will be set (*ATI Error / ALP ATI Error*). The flag status is only updated again when a new ATI algorithm is performed.

Re-ATI will not be repeated immediately if an ATI Error occurs. A configurable time (*Re-ATI retry time*) will pass where the re-ATI is momentarily suppressed. This is to prevent the re-ATI repeating indefinitely. An ATI error should however not occur under normal circumstances. The Re-ATI retry time has a maximum setting of *60 seconds*.

6 Sensing Modes

The IQS7211A automatically switches between different charging modes dependent on user interaction and other aspects. This is to allow for fast response, and low power consumption when applicable. The current mode can be read from the device (*Charging Mode*).

The modes are best illustrated by means of the following state diagram.

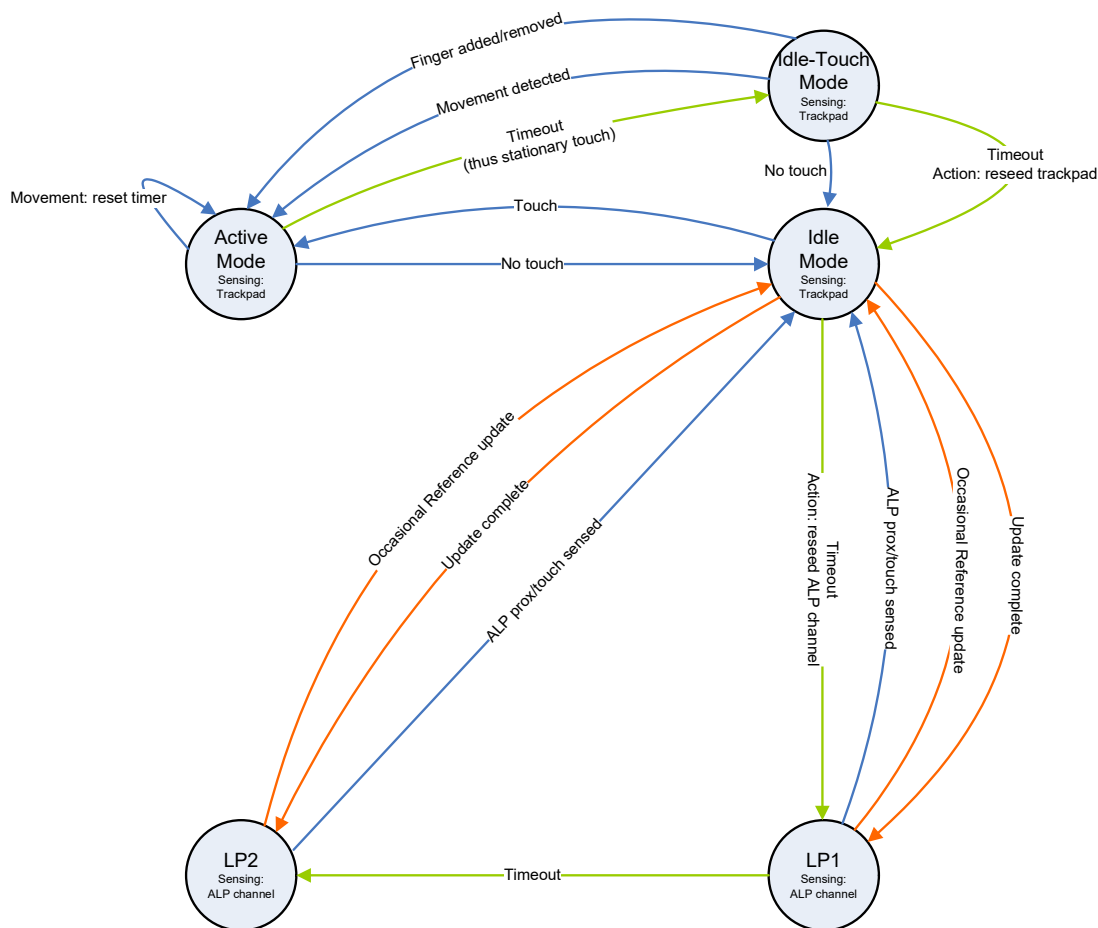

Figure 6.1: System Mode State Diagram

6.1 Report Rate

The report rate for each mode can be adjusted as required by the design. A faster report rate will have a higher current consumption but will give faster response to user interaction. *Active mode* typically has the fastest report rate, and the other modes are configured according to the power budget of the design, and the expected response time.

The report rate is configured by selecting the cycle time (in milliseconds) for each mode:

- > Report rate Active mode
- > Report rate Idle touch mode
- > Report rate Idle mode
- > Report rate LP1 mode

> Report rate LP2 mode

6.2 Mode Timeout

The timeout values can be configured, and once these times have elapsed, the system will change to the next state according to the state diagram. These times are adjusted by selecting a desired value (in seconds), for the specific timeout:

- > Timeout - Active mode
- > Timeout - Idle touch mode
- > Timeout - Idle mode
- > Timeout - LP1 mode

A timeout value of 0 will result in a 'never' timeout condition.

6.3 Manual Control

The default method (manual control disabled) allows the IQS7211A to automatically switch between modes and update reference values as shown in Figure 6.1. This requires no interaction from the master to manage the device, and is the recommended option.

The master can manage various states and implement custom power modes when Manual Control is enabled. The master needs to control the mode (Mode Select), and also manage the reference values by reseeding (TP Reseed) or manually writing to the reference registers (Reference values).

7 Trackpad

7.1 Configuration

7.1.1 Size Selection

The total number of Rx and Tx channels used for trackpad purposes must be configured (*Total Rxs / Total Txs*). This gives a rectangular area of channels, formed by rows and columns of Rx and Tx sensors.

7.1.2 Cycle Setup

The trackpad channels need to be packed into cycles. The Azoteq PC GUI can be used to assist with this setup. Each cycle can simultaneously sense one channel from Prox block A (Rx0-3) and one from Prox block B (Rx4-7). They must be for the same Tx, and the channel numbers are packed into the cycle numbers (*Cycle allocation registers*) accordingly. A value of 255 for the channel number indicates no channel is allocated.

It is best to select the Rxs as the even numbered sensors, so that optimal cycles/timeslot usage occurs. Similarly, a balanced number of sensors from A and B are optimal.

7.1.3 Trackpad Channel and Cycle Limitations

This product is limited to 32 trackpad channels, and 18 trackpad cycles. Any trackpad size and configuration that fits into these limits are possible to implement. Refer to Table 1.3 for more information.

7.1.4 Individual Channel Disabling

If the sensor is not a complete rectangle (this could be due to mechanical cut-outs or trackpad shape), there will be some channels that fall within the *Total Rxs / Total Txs* rectangle but do not exist. They must simply not be allocated to a sensing cycle (see Section 7.1.2). The channel numbers are however still allocated for the complete rectangle (see Section 5.1.1).

7.1.5 Rx/Tx Mapping

The Rxs and Txs of the trackpad can be assigned to the trackpad in any order to simplify PCB layout and design. The *Rx/Tx mapping* configures which actual Rx and Tx electrodes are used for the trackpad. The Rxs are specified first, up until the number of Rxs as defined by the *Total Rxs*, then the Txs follow immediately.

Following the example in Table 5.1, the *Rx/Tx mapping* settings will be as follows:

```
RxTxMapping[0] = 0  
RxTxMapping[1] = 4  
RxTxMapping[2] = 1  
RxTxMapping[3] = 5  
RxTxMapping[4] = 8  
RxTxMapping[5] = 10  
RxTxMapping[6] = 2  
RxTxMapping[7..11] = n/a
```

7.2 Trackpad Outputs

The channel count variation (deltas) and touch status outputs are used to calculate finger location data.

7.2.1 Number of Fingers

This gives an indication of the number of active finger inputs on the trackpad (No of fingers).

7.2.2 Relative XY

If there is only one finger active, a Relative X and Relative Y value is available. This is a signed 2's complement 16-bit value. It is a delta of the change in X and Y, in the scale of the selected output resolution.

7.2.3 Absolute XY

For all the multi-touch inputs, the absolute finger position (Absolute X/Y), in the selected resolution (Resolution X/Y) of the trackpad, is available.

7.2.4 Touch Strength

This value (Touch strength) indicates the strength of the touch by giving a sum of all the deltas associated with the finger, and therefore varies according to the sensitivity setup of the sensors.

7.2.5 Area

The number of channels associated with a finger is provided here. This area is usually equal to or smaller than the number of touch channels under the finger. (Finger 1 area) / (Finger 2 area).

7.2.6 Tracking Identification

The fingers are tracked from one cycle to the next, and the same finger will be in the same position in the memory map. The memory location thus identifies the finger.

7.3 Maximum Number of Multi-touches

The maximum number of allowed multi-touches is configurable (Max multi-touches) up to 2 points. If more than the selected value is sensed, a flag is set (Too Many Fingers) and the XY data is cleared.

7.4 XY Resolution

The output resolution for the X and Y coordinates are configurable (X/Y Resolution). The on-chip algorithms use 256 points between each row and column. The resolution is defined as the total X and total Y output range across the complete trackpad.

7.5 Stationary Touch

A stationary touch is defined as a point that does not move outside of a certain boundary within a specific time. This movement boundary or threshold can be configured (Stationary touch movement threshold) and is defined as a movement in either X or Y in the configured resolution.

The device will switch to *Idle-Touch* mode when a stationary point is detected for the active mode timeout period, where a lower duty cycle can be implemented to save power in applications where long touches are expected.

If movement is detected, a status flag (*TP Movement*) is set.

7.6 Multi-touch Finger Split

The position algorithm looks at areas (polygons) of touches and calculates positional data from this. Two fingers near each other could have areas touching, which would merge them incorrectly into a single point. A finger split algorithm is implemented to separate these merged polygons into multiple fingers. There is a *Finger split factor* which can be adjusted to determine how aggressive this finger splitting must be implemented. A value of '0' will not split polygons, and thus merge any fingers with touch channels adjacent (diagonally also) to each other.

7.7 XY Output Flip & Switch

By default, X positions are calculated from the first column to the last column. Y positions are by default calculated from the first row to the last row. The X and/or Y output can be flipped (*Flip X / Flip Y*), to allow the [0, 0] co-ordinate to be defined as desired. The X and Y axes can also be switched (*Switch XY Axis*) allowing X to be the Tx's, and Y to be along the Rx's. *Note: The channel numbers are still assigned the same way, first along the Rx's, then to the next Tx, it is not affected by this setting.*

7.8 XY Position Filtering

Stable XY position data is available due to two on-chip filters, namely the Moving Average (MAV) filter, and the Infinite Impulse Response (IIR) filter. The filters are applied to the raw positional data. It is recommended to keep both filters enabled for optimal XY data.

7.8.1 MAV Filter

If enabled (*MAV Filter*), raw XY points from the last two cycles are averaged to give the filter output.

7.8.2 IIR Filter

The IIR filter, if enabled (*IIR Filter*), can be configured to select between a dynamic and a static filter (*IIR Static*).

$$\text{Damping factor} = \text{Beta} / 256$$

Dynamic Filter

Relative to the speed of movement of a co-ordinate, the filter dynamically adjusts the amount of filtering (damping factor) performed. When fast movement is detected, and quick response is required, less filtering is done. Similarly, when a co-ordinate is stationary or moving at a slower speed, more filtering can be applied.

The damping factor is adjusted depending on the speed of movement. Three of these parameters are adjustable to fine-tune the dynamic filter if required:

- > *XY dynamic filter - bottom speed*
- > *XY dynamic filter - top speed*

> Dynamic filter bottom beta

The speed is defined as the distance (in the selected resolution) travelled in one cycle (pixels/cycle).

Figure 7.1: Dynamic Filter Parameters

Static Filter

Co-ordinates filtered with a fixed but configurable damping factor (XY static beta) are obtained when using the static filter (IIR Static). It is recommended that the dynamic filter is used due to the advantages of a dynamically changing damping value.

7.9 X & Y Trim

Due to boundary conditions at the edges of the trackpad, it is unlikely that the X and Y extreme values will be achievable (0 and X/Y Resolution). To be able to achieve this, the edges can be trimmed with configurable amount (X Trim / Y Trim) on-chip. For example, say X Trim is set to 0, and a finger on the left of the trackpad gives a minimum X output of 48, and a maximum of 960 for a finger to the far right (for X resolution set to 1000). Then an X Trim = 50 could be used to trim away the 'dead' area, and the full 0 to 1000 range will be achievable.

8 Gestures

The following on-chip gestures are available:

- > 1 finger gestures (*Gestures*)
 - A single tap
 - A press and hold
 - Swipe X+
 - Swipe X-
 - Swipe Y+
 - Swipe Y-

Each single finger gesture can individually be enabled and disabled by setting or clearing the corresponding bits in the register *Gesture Enable*.

All gestures are calculated relative to their starting coordinates, i.e., the first coordinate at which the touch was detected. Furthermore, if at any time during a gesture, more than the required number of touches is detected, the gesture will be invalidated.

8.1 Single Tap

The single tap gesture requires that a touch is made and released in the same location and within a short period of time. Some small amount of movement from the initial coordinate must be allowed to compensate for shift in the finger coordinate during the release. This bound is defined in register *Tap distance*, which specifies the maximum deviation in pixels the touch can move before a single tap gesture is no longer valid.

Similarly, the *Tap time* register defines the maximum duration (in ms) that will result in a valid gesture. That is, the touch should be released before the time in *Tap time* is reached.

A valid single tap gesture will be reported (*Single Tap*) in the same processing cycle as the touch release was detected and will be cleared on the next cycle. No movement will be reported in the relative XY registers (*Relative X* and *Relative Y*) during this gesture

Since the gesture reports after the finger is removed, the location of the tap gesture is placed in the *Absolute X/Y* registers of finger 1 at this time. With *No of fingers* set to 0, this will not look like an active finger, and is just a repetition of the location of the tap that has occurred for the main controller to utilise.

8.2 Press and Hold

The same register that defines the bounds for the single tap gesture (*Tap distance*) is used for the press and hold gesture. If the touch deviates more than the specified distance, the gesture is no longer valid. However, if the touch remains within the given bound for longer than the period (in ms), defined as the sum of the register values in *Tap time* and *Hold time*, a press and hold gesture will be reported (*Press and hold*). The gesture will continue to be reported until that specific finger is released.

No data will be reported in *Relative X* and *Relative Y* before the defined maximum hold period is reached, however, the relative data will be reported thereafter. This allows for features such as drag-n-drop.

8.3 Swipe (X-, X+, Y-, Y+)

All four swipe gestures work in the same manner and are only differentiated in their direction. The direction is defined with respect to the origin (0, 0) of the trackpad (Channel 0). If the touch is moving away from the origin, it is considered a positive swipe (+) and if it is moving towards the origin, it is a negative swipe (-). Whether the swipe is of the type X or Y is defined by which axis the touch is moving approximately parallel to. A swipe gesture event is only reported when a moving touch meets all three of the following conditions:

1. A minimum distance is travelled from its initial coordinates, as defined in pixels by the value in registers Swipe x distance and Swipe y distance.
2. The distance in (1) is covered within the time specified in Swipe time (in ms).
3. The angle of the swipe gesture, as determined by its starting coordinate and the coordinate at which conditions (1) and (2) were first met, does not exceed the threshold in Swipe angle with regards to at least 1 of the axes. The value in register Swipe angle is calculated as $64 \tan \theta$, where θ is the desired angle (in degrees).

The respective swipe gesture will be reported for 1 cycle (Swipe X-, X+, Y-, Y+) when all these conditions are met. The relative distance travelled will be reported in registers Relative X and Relative Y throughout.

8.4 Switching Between Gestures

For all single finger gestures, it is necessary to release all touches before any new gesture can be made and validated.

9 Hardware Settings

Settings specific to hardware and the ProxFusion® Module charge transfer characteristics can be changed.

Below some are described, the other hardware parameters are not discussed as they should only be adjusted under guidance of Azoteq support engineers.

9.1 Main Oscillator

The main oscillator frequency can be configured to 14MHz or 18MHz (*14MHz/18MHz*). When 18MHz is selected the minimum VDD allowed increases, please see Section [3.2](#) for details.

Smaller adjustments to incrementally decrease the main oscillator can be made (*Main Osc Adj*).

9.2 Charge Transfer Frequency

The charge transfer frequency (f_{xfer}) can be configured using the product GUI, and the relative parameters (*Charge Transfer Frequency*) will be provided. For high resistance sensors (such as ITO), it might be needed to decrease f_{xfer} .

9.3 Reset

9.3.1 Reset Indication

After a reset, the *Show Reset* bit will be set by the system to indicate the reset event occurred. This bit will clear when the master sets the *Ack Reset*, if it becomes set again, the master will know a reset has occurred, and can react appropriately.

9.3.2 Software Reset

The IQS7211A can be reset by means of an I²C command (*SW Reset*). This reset will take effect shortly after the SW Reset bit has been set and the I²C communication window terminated.

9.3.3 Hardware Reset

The MCLR / VPP pin (active LOW) can be used to reset the device. For more details see Section [4.2](#).

10 Additional Features

10.1 GUI for Parameter Setup

The Azoteq product GUI can be utilised to configure the optimal settings required for the specific hardware. The device performance can be easily monitored and evaluated in the graphical environment until the optimal configuration is obtained. Once these parameters have been finalised, there are two options for production, namely to program the IC with the firmware integrated with the specific settings/parameters, or to use a default configured IC and then perform the device setup over I²C after power-up.

10.1.1 Automated Start-up

If the IC is programmed with the application firmware bundled with settings specifically configured for the current hardware, then an automated start-up is achieved. These parameters are used as the default values without requiring any setup from the master. After power-up the device will automatically use the settings and perform the configuration/setup accordingly.

The firmware with design specific defaults can be obtained from the GUI by configuring the device and then exporting a HEX file. This file is then used to program the blank IQS721xy device. For large volume orders Azoteq can provide pre-programmed devices with customer specific firmware.

Two bytes (*Settings version number*) are available so that the designer can label and identify the user selected default start-up settings. This allows the master to verify if the device firmware has the intended configuration as required.

10.1.2 Manual Start-up

If the device is not programmed with customer specific settings, then they need to be configured by the master via I²C. The parameters can still be obtained using the GUI, but then these need to be configured in the memory map accordingly.

The device will thus be programmed with defaults not necessarily applicable to the current application. It is recommended that the whole memory map is overwritten to be sure all settings are as intended. Once this has been done set the re-ATI bits for the trackpad and ALP channel, so that the ATI can be executed on the intended settings.

10.2 Watchdog Timer (WDT)

A software watchdog timer is implemented to improve system reliability.

The working of this timer is as follows:

- > A software timer t_{WDT} is linked to the LFTMR (Low frequency timer) running on the "always on" Low Frequency Oscillator (10 kHz).
- > This timer is reset at a strategic point in the main loop.
- > Failing to reset this timer will cause the appropriate ISR (interrupt service routine) to run.
- > This ISR performs a software triggered POR (Power on Reset).
- > The device will reset, performing a full cold boot.

10.3 RF Immunity

The IQS7211A has immunity to high power RF noise. To improve the RF immunity, extra decoupling capacitors are suggested on V_{REGA} , V_{REGD} and V_{DD} .

Place a 100pF in parallel with the 2.2 μ F ceramic on V_{REGA} , V_{REGD} and V_{DD} . All decoupling capacitors should be placed as close as possible to the V_{DD} and V_{REG} pads.

If needed, series resistors can be added to Rx electrodes to reduce RF coupling into the sensing pads. Normally these are in the range of 470 Ω -1k Ω . PCB ground planes also improve noise immunity.

10.4 Additional Non-Trackpad Channels

Unused mutual capacitive channels can be used to design additional buttons or sliders. Note that the channels will still provide XY data output, which can be ignored (or utilised) by the master.

10.5 Version Information

See Table [A.1](#)

11 I²C Interface

11.1 I²C Module Specification

The device supports a standard two wire I²C interface with the addition of an RDY (ready interrupt) line. The communications interface of the IQS7211A supports the following:

- > *Fast-mode-plus* standard I²C up to 1MHz.
- > Streaming data as well as event mode.
- > The master may address the device at any time according to the comms request setting (see *Section 11.9.2*). However for optimal usage, such as power consumption, the RDY is strongly recommended.
- > The provided interrupt line (RDY) is an open-drain active low implementation and indicates a communication window.

The IQS7211A implements 8-bit addressing with 2 bytes at each address. Two consecutive read-/writes are required in this memory map structure. The two bytes at each address will be referred to as "byte 0" and "byte 1".

11.2 I²C Address

The IQS7211A has a fixed I²C address of 0x56.

Other address options exist on special request. Please contact Azoteq.

11.3 I³C Compatibility

This device is not compatible with an I³C bus due to clock stretching allowed for data retrieval.

11.4 Memory Map Addressing

11.4.1 8-bit Address

Most of the memory map implements an 8-bit addressing scheme for the required user data. For all application requirements this should be adequate.

11.4.2 Extended 16-bit Address

For development purposes larger blocks of data (such as the trackpad 16-bit channel count values) are found in an extended 16-bit memory addressable location. It is possible to only address each Block as an 8-bit address, and then continue to clock into the next address locations. For example, address 0xE000 is where the trackpad count values are located. If you thus do the following, you will read the count values from address 0xE000 to 0xE003:

Figure 11.1: Extended Addressing Comms Diagram

However, if you need to address a specific byte in that extended memory map space, then you will need to address using the full 16-bit address (note the 16-bit address is high byte first, unlike the data which is low byte first):

Figure 11.2: Extended Addressing Comms Diagram (Specific Channel)

11.5 Data

The data is 16-bit words, meaning that each address obtains 2 bytes of data. For example, address 0x10 will provide two bytes, then the next two bytes read will be from address 0x11. The 16-bit data is sent in little endian byte order (least significant byte first).

11.6 I²C Timeout

If the communication window is not serviced within the *I²C timeout period* (in milliseconds), the session is ended (RDY goes HIGH), and processing continues as normal. This allows the system to continue and keep reference values up to date even if the master is not responsive, however the corresponding data was missed/lost, and this should be avoided.

11.7 Terminate Communication

A standard I²C STOP ends the current communication window. If multiple I²C transactions need to be done, then they should be strung together using repeated-start conditions instead of giving a STOP. This will allow the communication to occur in the same session.

11.8 RDY/IRQ

The communication has an open-drain active-LOW RDY signal to inform the master that updated data is available. It is optimal for the master to use this as an interrupt input and obtain the data accordingly. It is also useful to allow the master MCU to enter low-power/sleep allowing wake-up from the touch device when user presence is detected.

11.9 Event Mode Communication

The device can be set up to bypass the communication window when no activity is sensed (*Event Mode*). This is usually enabled since the master does not want to be interrupted unnecessarily during every cycle if no activity occurred. The communication will resume (RDY will indicate available data) if an enabled event occurs. It is recommended that the RDY be placed on an interrupt-on-pin-change input on the master.

11.9.1 Events

Numerous events can be individually enabled to trigger communication, they are:

- Gesture events (*Gesture Event*): *enabled gestures* will trigger event.
- Trackpad events (*TP Event*): event triggered if there is a change in X/Y value, or if a finger is added or removed from the trackpad.
- Touch events (*TP Touch Event*): event only triggers if a channel has a change in a touch state. This is mostly aimed at channels that are used for traditional buttons, where you want to know only when a status is changed.
- Re-ATI (*Re-ATI Event*): one communication cycle is given to indicate the re-ATI occurred (*TP / ALP Re-ATI Occurred*).
- Proximity/Touch on ALP (*ALP Event*): event given on state change.

11.9.2 Force Communication/Polling

The master can initiate communication even while RDY is HIGH (inactive). The default method is that the IQS7211 will clock stretch until an appropriate time to complete the I²C transaction. The master firmware will not be affected (if clock stretching is correctly handled).

If the associated clock stretching cannot be allowed, then an alternative comms request method can be enabled (*Comms Request EN*). To achieve this, the master will do communication when RDY is not active (thus forcing comms), and it will write a comms request to the device. This comms request is as follows:

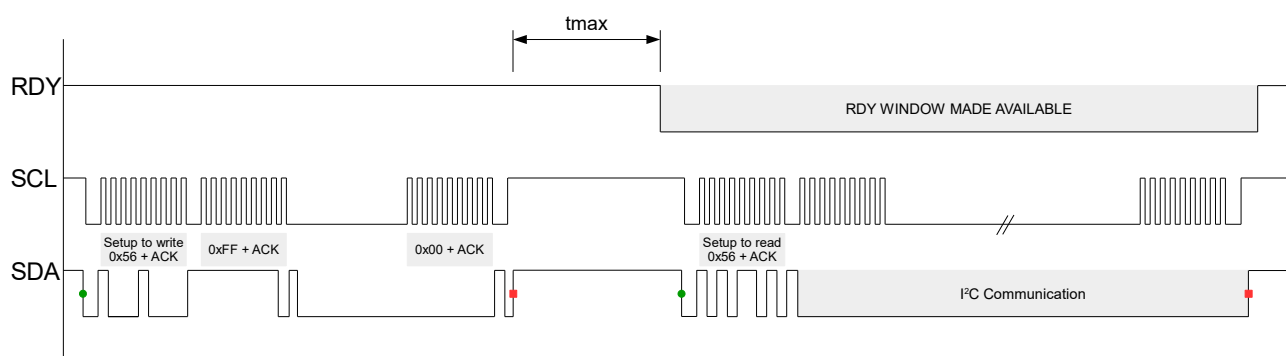

Figure 11.3: Force Comms Diagram

After this request for communication has been sent, then the next available communication window will become available as normal (thus RDY going LOW).

For optimal program flow, it is suggested that RDY is used to sync on new data. The forced/polling method is only recommended if the master must perform I²C and Event Mode is active.

12 I²C Memory Map - Register Descriptions

For a more detailed description please see [Appendix A](#)

13 Implementation and Layout

13.1 Layout Fundamentals

NOTE

Information in the following Applications section is not part of the Azoteq component specification, and Azoteq does not warrant its accuracy or completeness. Azoteq's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

13.1.1 Power Supply Decoupling

Azoteq recommends connecting a combination of a 4.7 μF plus a 100 pF low-ESR ceramic decoupling capacitor between the VDD and VSS pins. Higher-value capacitors may be used but can impact supply rail ramp-up time. Decoupling capacitors must be placed as close as possible to the pins that they decouple (within a few millimetres).

Figure 13.1: Recommended Power Supply Decoupling

13.1.2 VREG

The VREG pin requires a 2.2 μF capacitor to regulate the LDO internal to the device. This capacitor must be placed as close as possible to the microcontroller. The figure below shows an example layout where the capacitor is placed close to the IC.

Figure 13.2: VREG Capacitor Placement Close to IC

13.1.3 WLCSP Light Sensitivity

The CSP package is sensitive to infrared light. When the silicon IC is subject to the photo-electric effect, an increase in leakage current is experienced. Due to the low power consumption of the IC this causes a change in signal and is common in the semiconductor industry with CSP devices.

If the IC could be exposed to IR in the product, then a dark glob-top epoxy material should cover the complete package to block infrared light. It is important to use sufficient material to completely cover the corners of the package. The glob-top also provides further advantages such as mechanical strength and shock absorption.

 - 00: 1023
 - 01: 2047
 - 10: 4095
 - 11: 16384
- > Bit 7-5: **LP2 Auto Prox Cycles**- Number of LP2 auto-prox cycles
 - 000: 4
 - 001: 8
 - 010: 16
 - 011: 32
 - 1xx: Auto-prox disabled
- > Bit 4-2: **LP1 Auto Prox Cycles**- Number of LP1 auto-prox cycles
 - 000: 4
 - 001: 8
 - 010: 16
 - 011: 32
 - 1xx: Auto-prox disabled
- > Bit 1-0: **Init Delay**- Initial cycles delay
 - 00: 4
 - 01: 16

- 10: 32
- 11: 64

Table A.11: Trackpad Settings (0x60)

Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Total Rxs								Reserved		MAV Filter	IIR Static	IIR Filter	Switch XY Axis	Flip Y	Flip X

- > Bit 15-8: **Total Rxs**- used for trackpad
- > Bit 7-6: Unused
- > Bit 5: **MAV Filter**- Moving averaging filter
 - 0: XY MAV filter on touch position disabled
 - 1: XY MAV filter on touch position enabled (recommended)
- > Bit 4: **IIR Static**- IIR filtering method for the XY data points
 - 0: Damping factor for IIR filter is dynamically adjusted relative to XY movement (recommended)
 - 1: Damping factor for IIR filter is fixed
- > Bit 3: **IIR Filter**- IIR filter
 - 0: XY IIR filter disabled
 - 1: XY IIR filter enabled (recommended)
- > Bit 2: **Switch XY Axis**- Switch X and Y axes
 - 0: Rxs are arranged in trackpad columns (X), and Txs in rows (Y)
 - 1: Txs are arranged in trackpad columns (X), and Rxs in rows (Y)
- > Bit 1: **Flip Y**- Flip Y output values
 - 0: Keep default Y values
 - 1: Invert Y output values
- > Bit 0: **Flip X**- Flip X output values
 - 0: Keep default X values
 - 1: Invert X output values

Table A.12: ALP Setup (0x72)

Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Reserved						ALP Filter	Sensor Type	Rx7_EN	Rx6_EN	Rx5_EN	Rx4_EN	Rx3_EN	Rx2_EN	Rx1_EN	Rx0_EN

- > Bit 15-10: Unused
- > Bit 9: **ALP Filter**- ALP count filter
 - 0: ALP count value is unfiltered
 - 1: ALP count filter enabled
- > Bit 8: **Sensor Type**- ALP sensing method
 - 0: ALP is setup for self-capacitive sensing
 - 1: ALP is setup for mutual-capacitive sensing
- > Bit 7-0: **RX_EN**- ALP Rx electrodes
 - 0: Rx disabled (not used for ALP)
 - 1: Rx enabled (forms part of ALP sensor)

Table A.13: ALP Tx Enable (0x73)

Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Reserved				Tx11_EN	Tx10_EN	Tx9_EN	Tx8_EN	Tx7_EN	Tx6_EN	Tx5_EN	Tx4_EN	Tx3_EN	Tx2_EN	Tx1_EN	Tx0_EN

- > Bit 15-12: Reserved
- > Bit 11-0: **TX_EN**- ALP Tx electrodes

- 0: Tx disabled (not used for ALP)
- 1: Tx enabled (forms part of ALP sensor)

Table A.14: Gesture Enable (0x80)

Gesture Enable															
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Reserved										Swipe Y-	Swipe Y+	Swipe X+	Swipe X-	Press and Hold	Single Tap

- > Bit 15-6: Unused
- > Bit 5: **Swipe Y-** - Swipe in negative Y direction
 - 0: Gesture disabled
 - 1: Gesture enabled
- > Bit 4: **Swipe Y+** - Swipe in positive Y direction
 - 0: Gesture disabled
 - 1: Gesture enabled
- > Bit 3: **Swipe X+** - Swipe in positive X direction
 - 0: Gesture disabled
 - 1: Gesture enabled
- > Bit 2: **Swipe X-** - Swipe in negative X direction
 - 0: Gesture disabled
 - 1: Gesture enabled
- > Bit 1: **Press and Hold** - Indicates a press and hold gesture
 - 0: Gesture disabled
 - 1: Gesture enabled
- > Bit 0: **Single Tap** - Indicates a single tap gesture
 - 0: Gesture disabled
 - 1: Gesture enabled
